

# A thermodynamic database for solder systems:

*COST 531 and the benefits of international collaboration*

Alan Dinsdale

NPL Materials Centre

National Physical Laboratory

Teddington, UK

GTT Workshop, Herzogenrath,  
Germany

4-6 June 2008

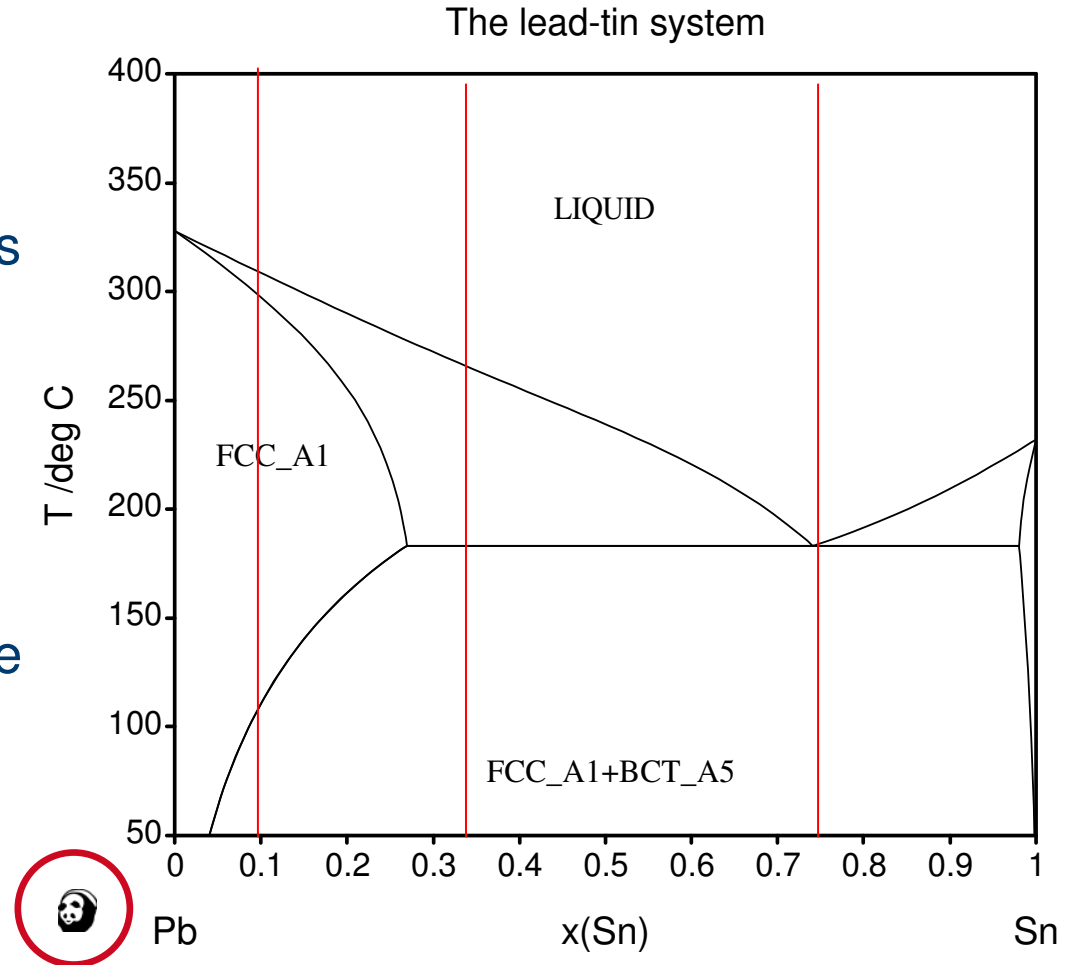

# Outline

- The need for Lead free solders
- COST (COST531 and MP0602)
- Thermodynamic database for lead free solders
- Scope and Standards
- Need for consistency
- Applications
- How you can access the database
- Conclusions

# The need for Lead free solders

# The need for Lead-free Solders

- Traditional solder
  - Pb-Sn
  - Electrician's solder (tinman's solder)
    - Eutectic Composition
    - Rapid solidification
  - Plumber's solder
    - ~Pb:Sn 2:1
    - Large solidification range
      - *Pasty range*
  - High-temperature solders
    - (*under-bonnet applications*)

# Problems with Lead

- **Environmental issues**

- **Toxic**

- Incorporated into bone marrow, nerve tissue, brain, kidneys..
    - Low levels affect the brain, central nervous system, lead to learning difficulties in children, impair physical and mental development

- **Disposal** of electrical and electronic equipment

- Lead leaching into groundwater from landfill

- European **legislation**

- Waste Electrical and Electronic Equipment (WEEE) Directive
      - Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2006 (RoHS)  
– *1<sup>st</sup> July 2006*

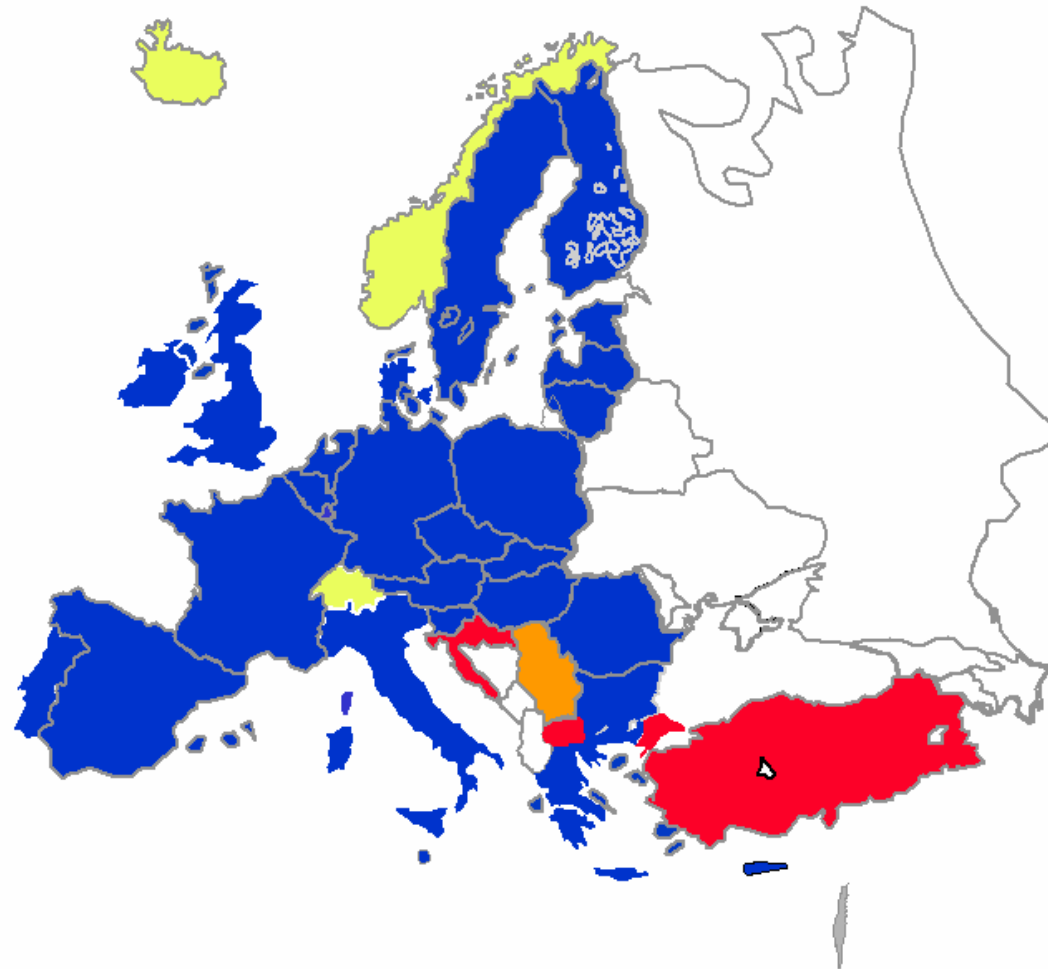

- Need for **coordinated European research** in support of European industry

What is COST ?

# What is COST ?

- European **CO**operation in the field of **S**cientific and **T**echnical research
- **Mission**: To strengthen Europe in scientific and technical research for peaceful purposes through the support of cooperation and interaction between European researchers
- **34** COST member states plus **1** cooperating member
- Supported by the European Commission through the **Framework Programme**
- Works through a series of **actions** in the form of networked research projects
- Aims to coordinate nationally funded research at a European level

# COST Countries

## ◆ 27 EU Member States

## ◆ Candidate countries

- ▶ Croatia\*
- ▶ Former Yugoslav Republic of Macedonia (FYROM)\*
- ▶ Turkey

## ◆ EFTA Member States

- ▶ Iceland
- ▶ Norway
- ▶ Switzerland

## ◆ Other European Countries

- ▶ Republic of Serbia\*

## ◆ COST Cooperating States

- ▶ Israel

# COST531

- **A European Action on Lead-free Soldering**

(March 2002 to March 2007)

*“...to increase the basic knowledge on possible alloy systems that can be used as lead-free solder materials and to provide a scientific basis for a decision which of these materials to use for different soldering purposes in order to replace the currently used lead-containing solders in the future.”*

- **45** research institutes from **17** countries

- **Working Groups**

- Groups 1&2: **Thermochemistry and Phase Diagrams**  
(Experimental + Modelling)

- Groups 3-6: Physical, Chemical Properties, Reliability  
Issues

# COST531 Outputs

- Thermodynamic database
  - Ag, Au, Bi, Cu, In, Ni, Pb, Pd, Sb, Sn, Zn
- Database of Physical Properties of Lead-free Solder Alloys
  - physical and mechanical properties of bulk solders and solder joints
- SURDAT Database of Lead-free Soldering Materials
- ATLAS of Microstructures of Pb-free solders and solder joints
- Synt@all” (SYNthesis of ALLoys)
- Publication (June 2008)
  - Volume 1: COST 531 Atlas of Phase Diagrams
  - Volume 2: COST 531/ELFNET Handbook of Solder Alloy Properties

# COST531 database managed by:

- Aleš Kroupa
- Adéla Zemanová
- Jan Vreštál
- Jirí Vízdal
- Andy Watson
- Alan Dinsdale

*“SOLDERS” is now available for lease with all major software for calculation of phase equilibria*

# Atlas of Solder Phase Diagrams

## Bi-Zn system

Several authors worked on the theoretical description of the Bi-Zn system - e.g. Malakhov [00Mal], Cleari et al. [55Ole], Bale et al. [77Bal], Girard [85Gir] nebo Wang et al. [93Wan]. Kim and Sanders [03Kim] attempted to describe properly the segregation region in the liquid, using two interaction parameters LIZ only instead of six used by Malakhov. Unfortunately, their description is not consistent with unary parameters ( ) of the „COST531“ database and therefore the data from Malakhov [00Mal] were used for this system. The changes of unary data were introduced and new value of  $G(\text{HCP\_ZN,BI:VA};0)$  from work of Moelans [03Moe] was accepted. New data were also introduced to model new experimental data from Vizdal et al. [07Viz] for solubility of Bi in HCP\_ZN Zn ( $G(\text{HCP\_ZN,BI,ZN:VA};0)$ ).

**Table of invariant reactions**

T / °C	Phases			Compositions / $x_{Bi}$		
254.5	RHOMBO_A7	LIQUID	HCP_ZN	0.016	0.081	0.998
271.4	LIQUID	RHOMBO_A7				
418.3	LIQUID 1	LIQUID 2	HCP_ZN	0.374	0.992	0.996
419.5	HCP_ZN	LIQUID				

### Phase information

Phase Name	Common Name	Structure Type	Pearson Symbol
LIQUID	Liquid		
RHOMBO_A7	(Bi)	A7	hR2
HCP_ZN	(Zn)	A3 mod	hP2

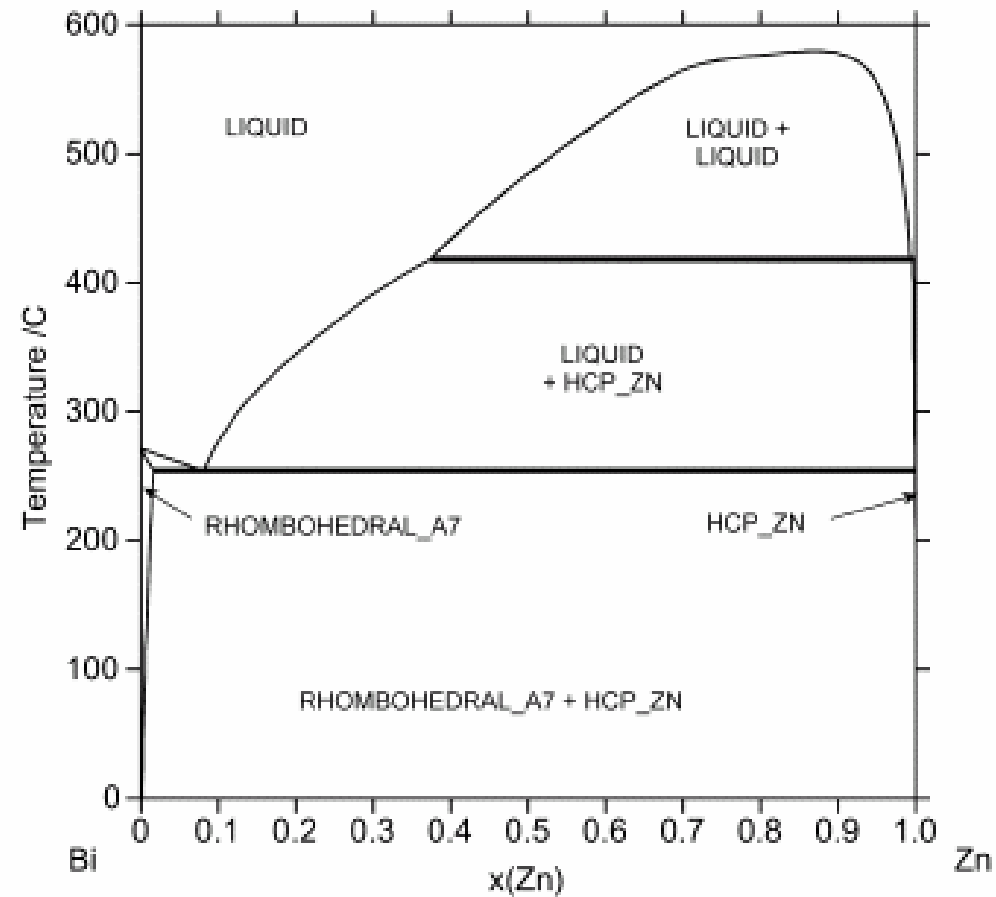

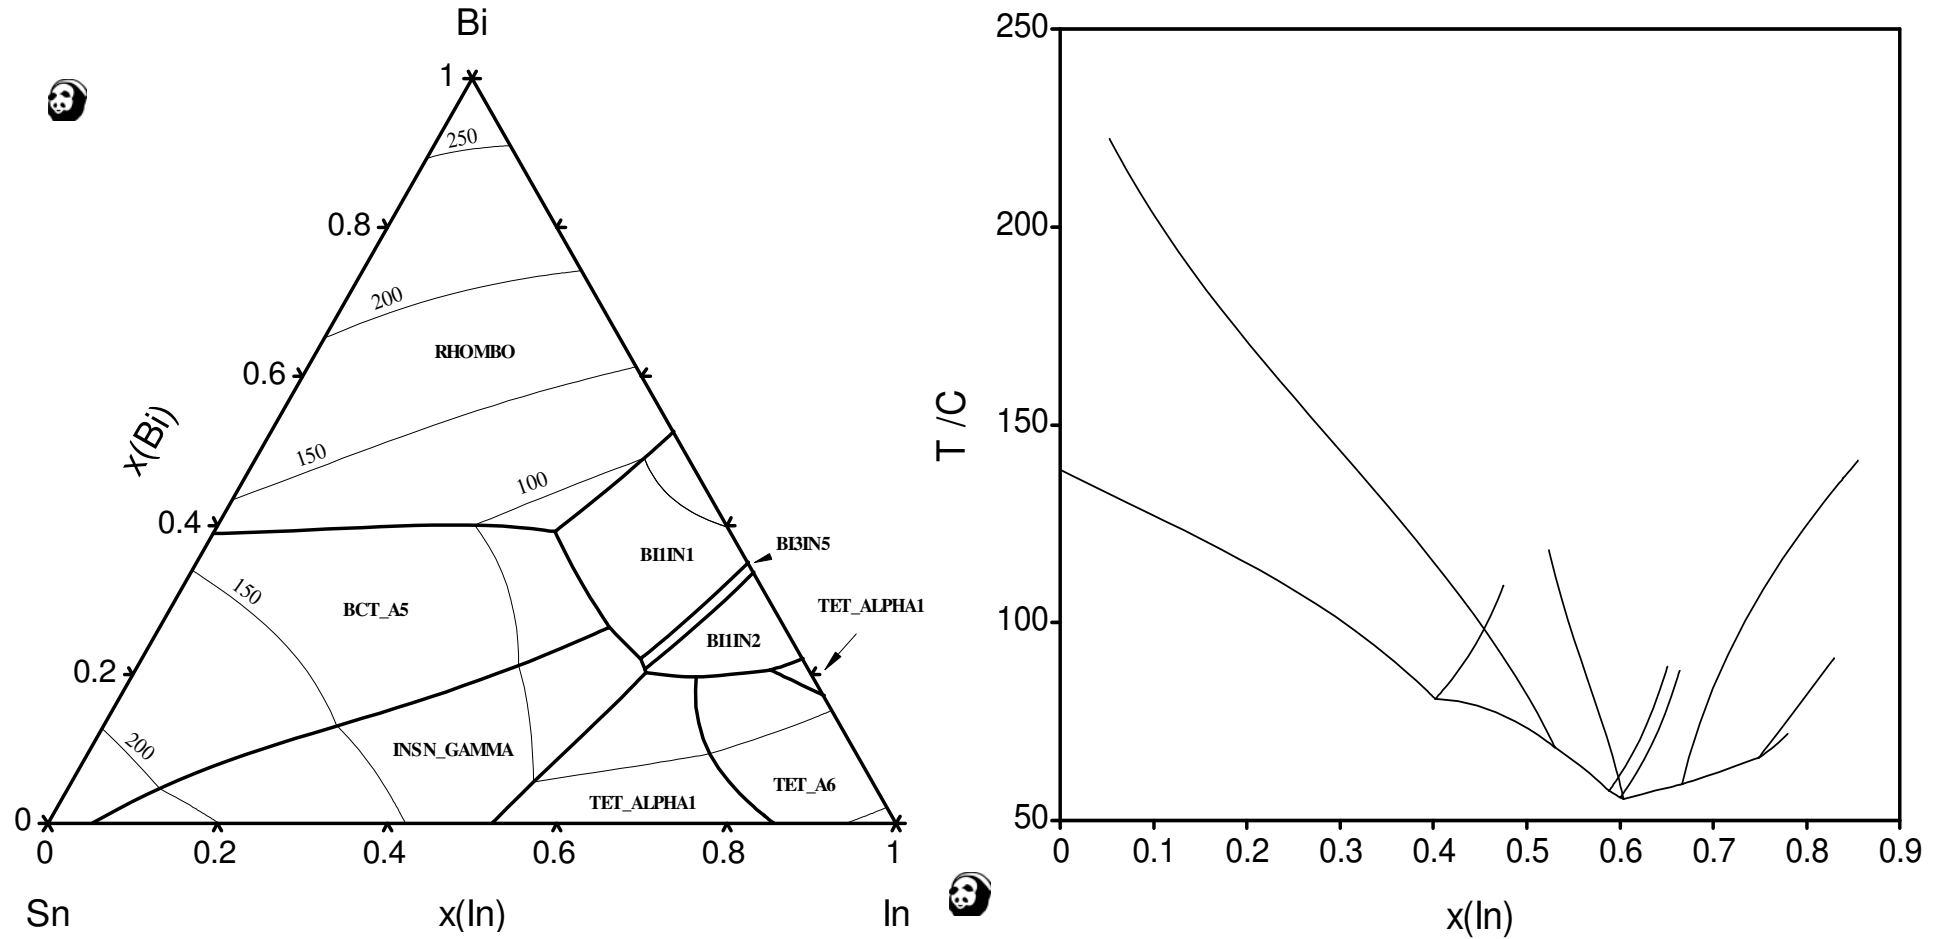

Fig. 1: ...

# A different view of liquidus projections

# HISOLD:

Advanced Solder Materials for High Temperature  
Application

# HISOLD: Main drivers

- We need **replacement** for **high temperature, high-Pb** containing alloys - Lead is toxic !
- Currently **exempt** from RoHS legislation ..... but future EU legislation is likely
- Preparation by the scientific and industrial community is important
- Research for replacements underway in **Japan and USA** (and in China)
- Major research programme in Japan funded by main Japanese car manufactures.
- Currently **no 'drop-in' lead-free alternative**

# High temperature solders

- **Solders with  $T_m \geq 230^\circ\text{C}$** 
  - **Electronics industry** for advanced packaging technologies
  - **Power circuits** (very high levels of conductivity required)
  - Automotive industry **under bonnet applications**
    - high current and low voltage, high temperatures within the engine area
  - **Multi-chip modelling (MCM)**
    - step soldering approach - soldering of various levels of the package with different solders with different melting points
    - upper limit around  $350^\circ\text{C}$  (limit set by polymer used in substrate)

# HISOLD: Scientific programme

- **Multidisciplinary and multiscale approach**
- **Establishment of materials property databases**
  - thermodynamics and kinetics
  - materials properties (structural, physical, electrical, mechanical ...)
  - process related properties of the solder and joint materials
- **Model**
  - formation of intermetallic compounds at solder/substrate interface
  - development of texture of reaction products in concentration gradients and of defect structures in vicinity of reaction interface
  - competitive nucleation and growth of intermediate phases
  - prediction of corrosion behaviour, deformation processes, failure modes etc. during fabrication and service
- **Understand**
  - thermo-mechanical fatigue
  - durability of interfaces and intermetallics
- **Identify optimum process conditions.**

# What are we hoping to achieve ?

- To **identify** a number of environmentally friendly **lead-free solder systems** suitable for high-temperature applications
- To define a comprehensive **set of data** for these potential solders
- To improve **collaboration** within Europe between academic institutions and industry
- To gain a **market lead** for European Electronic Manufacturers over competitors from Japan, China and United States, especially in areas where environmentally friendly and recyclable products are concerned
- To **strengthen** the position of the Universities and Research Institutions involved in materials science.

# Potential systems for high temperature Pb free solders

- Zn-Al with Mg, Ge, Ga, Bi, Sn
- Sn-Sb with Bi, Ag, Cu
- Ag-Bi with Au, Sn
- Au-Sn with ?
- Zn-Sn with Bi, Ag, Cu

# Development of a Thermodynamic database for lead free solders

# Database overview

- Why we need a thermodynamic database
- Methodology
- Issues of consistency
- Status of COST531 database for lead free solders
- Examples of assessment issues

# Why we need a thermodynamic database for solders

- Predict **phase equilibria** in multicomponent solders
- Model formation of the **intermetallics** at interface between substrate and the solder
- Understand issues of **contamination** of lead free solder through reworking of old solder joints
- Understand **solidification** properties
  - Liquidus and solidus temperatures of candidate solders
  - Solidification paths
  - Liquidus surface
  - Scheil simulation
- Predict **physical properties**
  - Surface tension and interfacial tensions – Butler equation
  - Volumes and densities – changes on solidification

# Methodology

- Choose unary data
  - SGTE unary database v4.4
- Search for binary data
  - SGTE/NPL solders database
  - Brno solders database
  - Literature
  - Data generated by COST 531
- Test for consistency/compatibility
  - MTDATA
  - ThermoCalc
  - Pandat
- “Competitive” software can be complementary

# CALPHAD approach

- Selection of appropriate **models** for phases
- **Critical assessment** of data for lower order systems
- Use well tested, reliable models to **extrapolate** from binary systems into ternary and higher order systems
- Introduce **high order parameters** where necessary
- **Testing** to ensure that extrapolations in temperature and composition are reasonable
  - Miscibility gaps
  - Inverted compound melting

# Models

The temperature and concentration dependency of Gibbs energy of studied phase:

$$G_m^f = G_{ref}^f + G_{id}^f + G_E^f + G_{mag}^f + G_P^f + \dots ,$$

$G_{ref}$  - the reference level for the molar Gibbs energy of the phase

$G_{id}$  - the contribution from the ideal mixing

$G_{ex}$  - excess Gibbs energy, which describes the influence of non-ideal behaviour on the thermodynamic properties of the phase

Other terms can be added related to contributions from e.g. the interface energy, energy of plastic deformation, magnetism, pressure etc.

Excess Gibbs energy – Redlich-Kister-Muggianu polynomial

$${}^E G = x_i x_j \sum_{k=0}^n L (x_i - x_j)^k$$

# Analysis of crystalline phases structure – selection of appropriate sublattice description

Phase Name	Number of sublattices	Stoichiometry				Constituents			
AUZN_GAMMA	4	0.15385	0.15385	0.23077	0.46153	Au, Zn	Au	Au, Zn	Zn
CUIN_GAMMA	3	0.654	0.115	0.231		Ag, Cu	Ag, Cu In	In, Sn	
BETA_INPD2	2	0.34	0.66			In	Pd		
INNI_CHI	3	1	1	1		Ni, Va	Ni	In, Ni	
IN3PD2	2	0.6	0.4			In	Ag, Pd		
LAVES_C15	2	2	1			Cu, Zn	Cu, Zn		
NI3SN2	3	0.5	0.25	0.25		Ni, Sn	Au, Ni	Au, Ni	
PDZN_GAMMA	2	2	9			Pd, Zn	Pd, Zn		
SBSN	2	1	1			Bi, Pb, Sb, Sn	Sb, Sn		
ZETA_AGZN	2	1	2			Zn	Ag, Zn		

# What do we mean by critical assessment ?

- Critical assessment is a process to generate a **set of reliable data** or diagrams which are self consistent and **represent all the available experimental data** for the system eg phase diagram, enthalpies of mixing, vapour pressures, ...
- It involves a **critical analysis of the experimental data** (Hultgren, Massalski etc)
- ..... followed by a **computer based optimisation process** to reduce the experimental data into a small number of model parameters
- ..... using **rigorous** theoretical basis underlying thermodynamics

# Example of consistency problem

# Issues of consistency

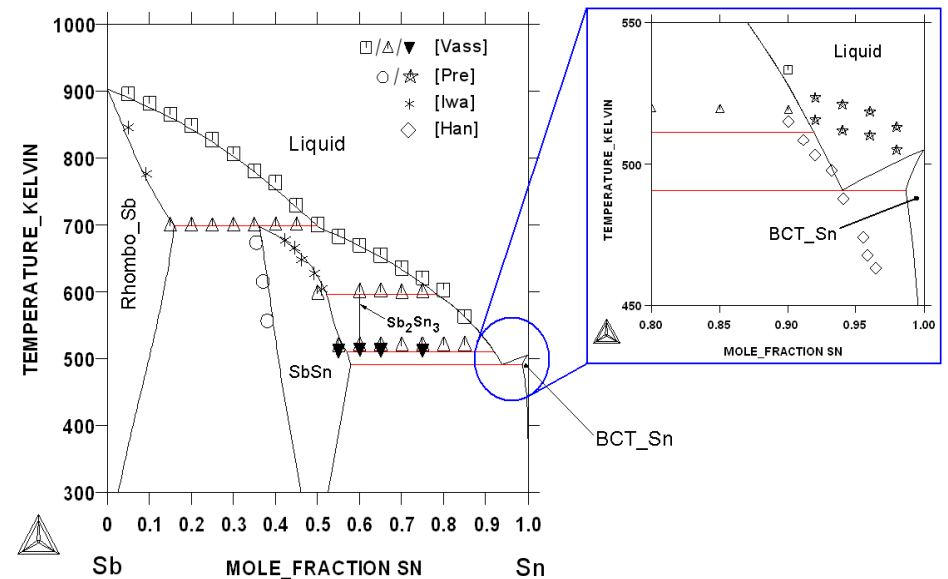

- Often a problem **combining** assessments
  - eg Cu-Ni, Cu-Sn and Ni-Sn to give Cu-Ni-Sn
- Potentially different **unary data** used for different assessments
  - Sn fcc and hcp
- Possibly different **models** used for crystalline phases
  - gamma brass
- Metastable phases might **extrapolate** badly
  - liquid phase data extrapolated over wide range of temperatures

# The reassessment of the Sb-Sn system

Calculated according to **Oh** utilizing unary data from  
**SGTE version 1.0** (original paper) and **version 4.4**

$G(\text{BCT\_A5,SB};0) \quad 1000 + \text{GHSERSB}$

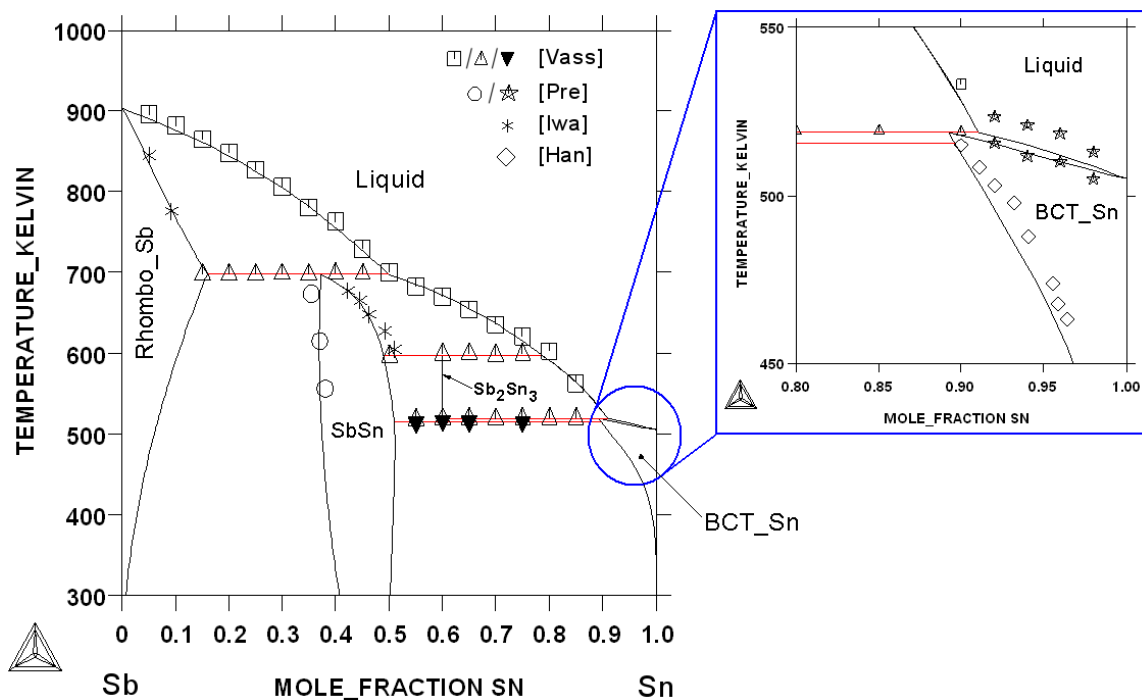

$13000 - 8 \cdot T + \text{GHSERSB}$

# The reassessment of the Sb-Sn system

Calculated according to our reassessment utilizing unary data from **SGTE version 4.4**

# Current status of the SOLDERS database

Scope: 11 elements

Ag, Au, Bi, Cu, In, Ni, Pb, Pd, Sb, Sn, Zn

Binary systems: All 55 binary systems except  
Ni-Sb and Pd-Sb

Selected ternary systems:

Ag-Au-Bi, Ag-Au-Sb, Ag-Bi-Sn, Ag-Cu-Ni, Ag-Cu-Pb,  
Ag-Cu-Sn, Ag-In-Sn, Ag-Ni-Sn  
Au-Bi-Sb, Au-In-Sb, Au-In-Sn, Au-Ni-Sn  
Bi-In-Sn, Bi-Sb-Sn, Bi-Sn-Zn  
Cu-In-Sn, Cu-Ni-Pb, Cu-Ni-Sn  
In-Sb-Sn, In-Sn-Zn

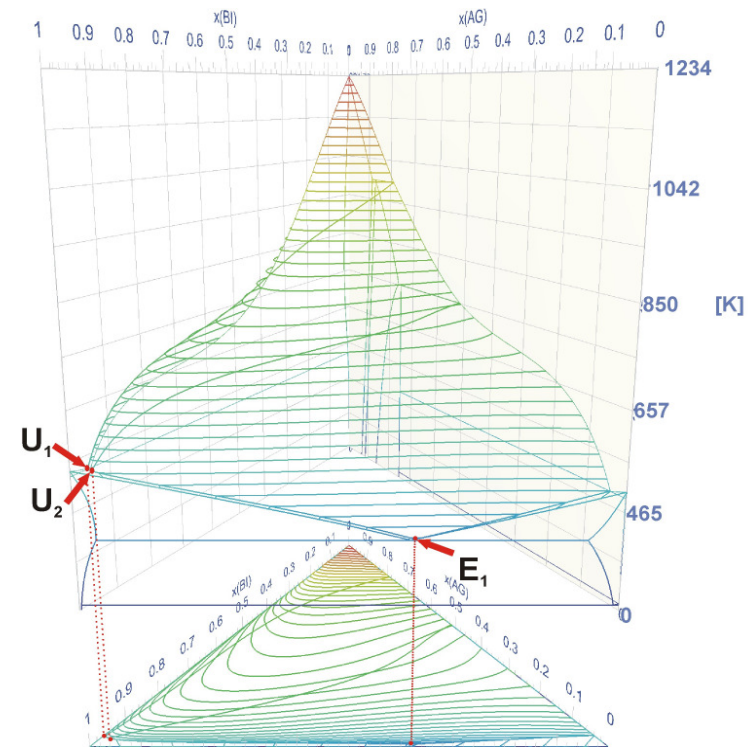

# Assessments !!!

# APPLICATIONS

# Applications

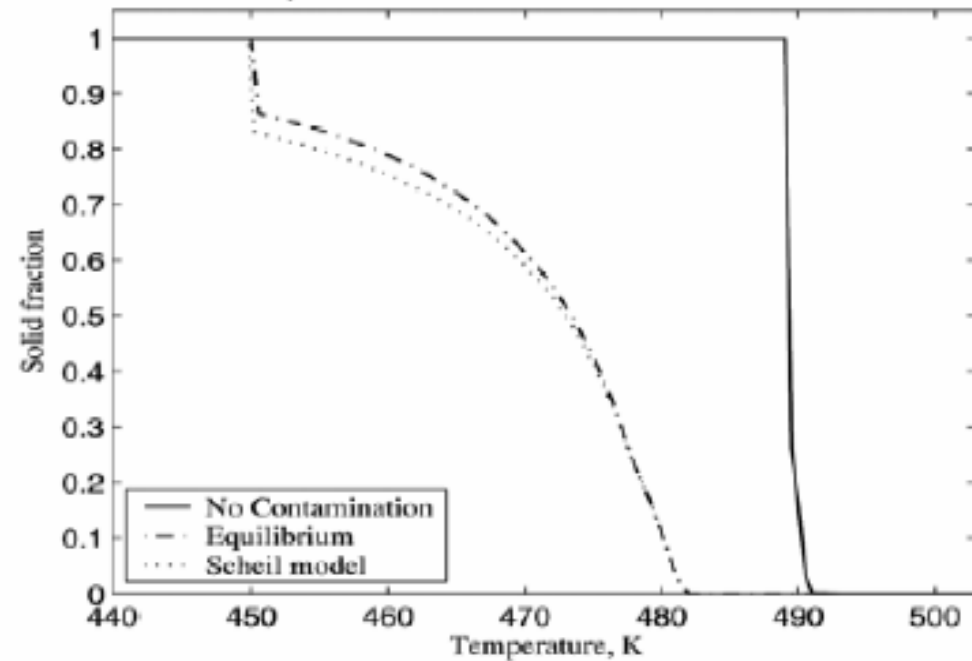

- Understand issues of **contamination of lead free solder** through reworking of old solder joints
- Understand **volume changes** associated with solidification reaction – tin pest
- Predict **liquidus and solidus temperatures** of candidate solders
- Model **formation of the intermetallics** at interface between substrate and the solder
- Model **surface tension**

# Contamination of lead free joints

a) 405 + 5 wt.% Sn-37Pb

b) 405 + 20 wt.% Sn-37Pb

# Enthalpy release

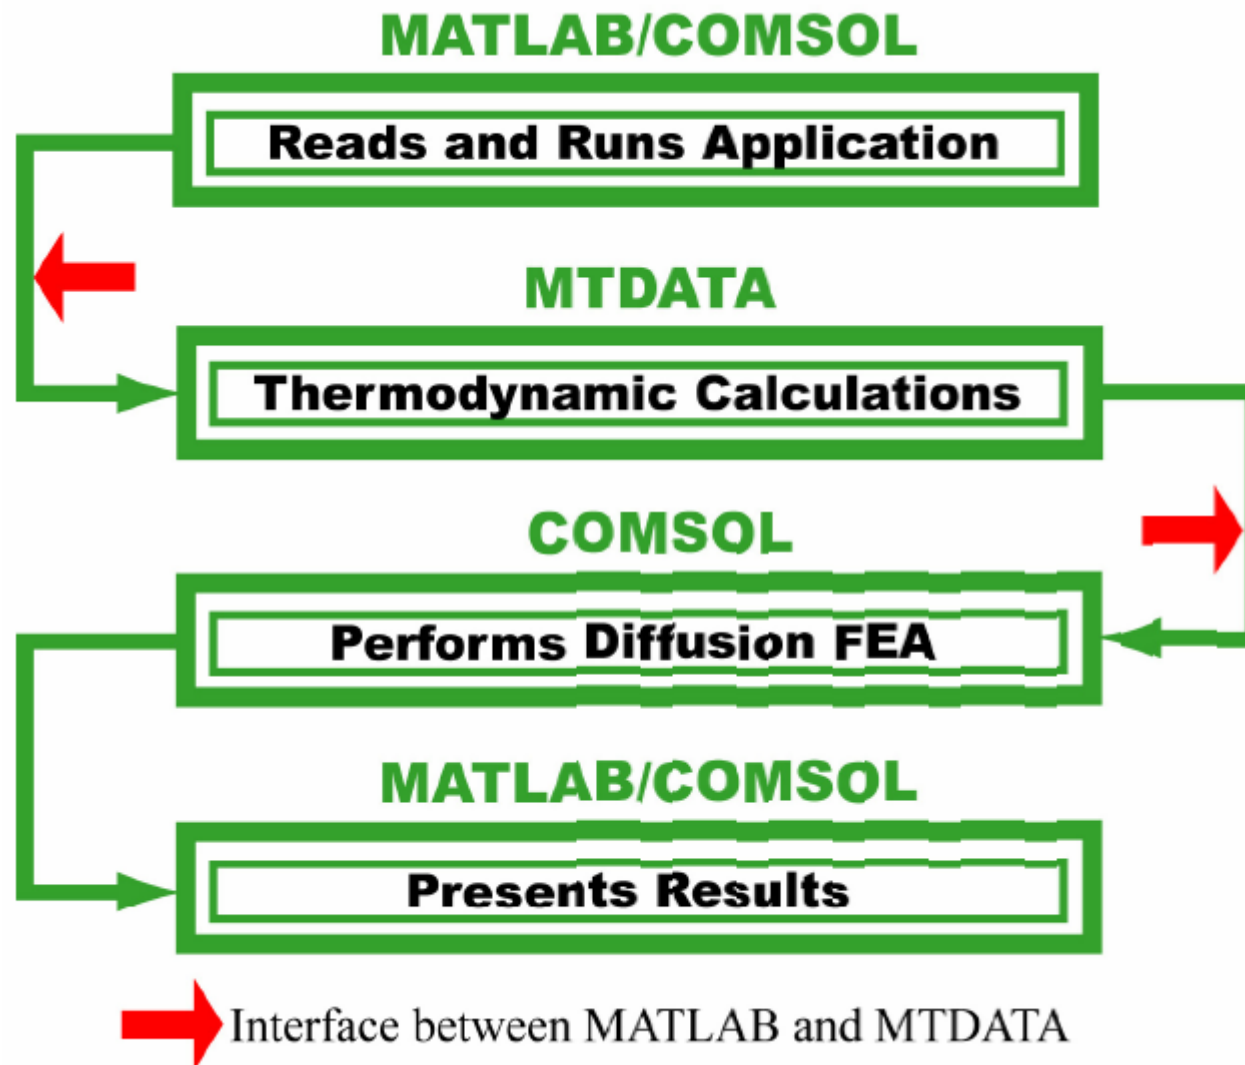

# Calculated heat capacity

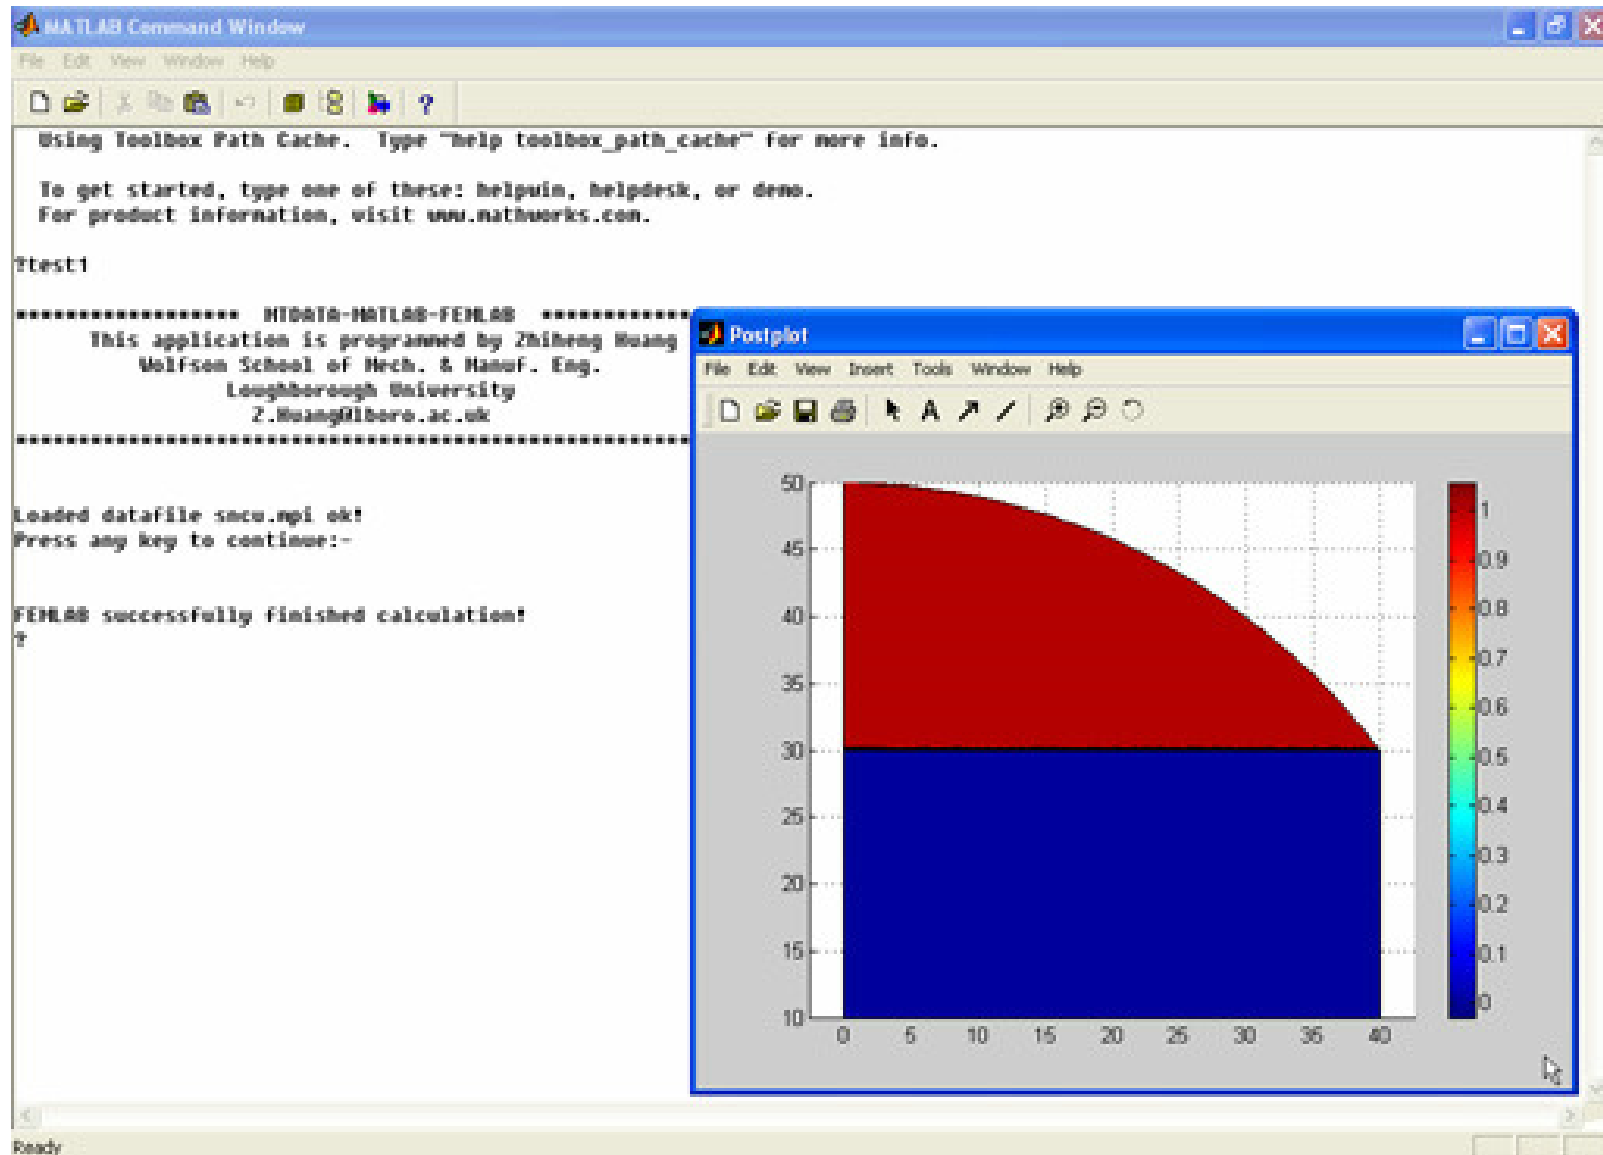

# Model formation of the intermetallics at interface

# Modelling diffusive Sn flux

# MTDATA-MATLAB-COMSOL interface

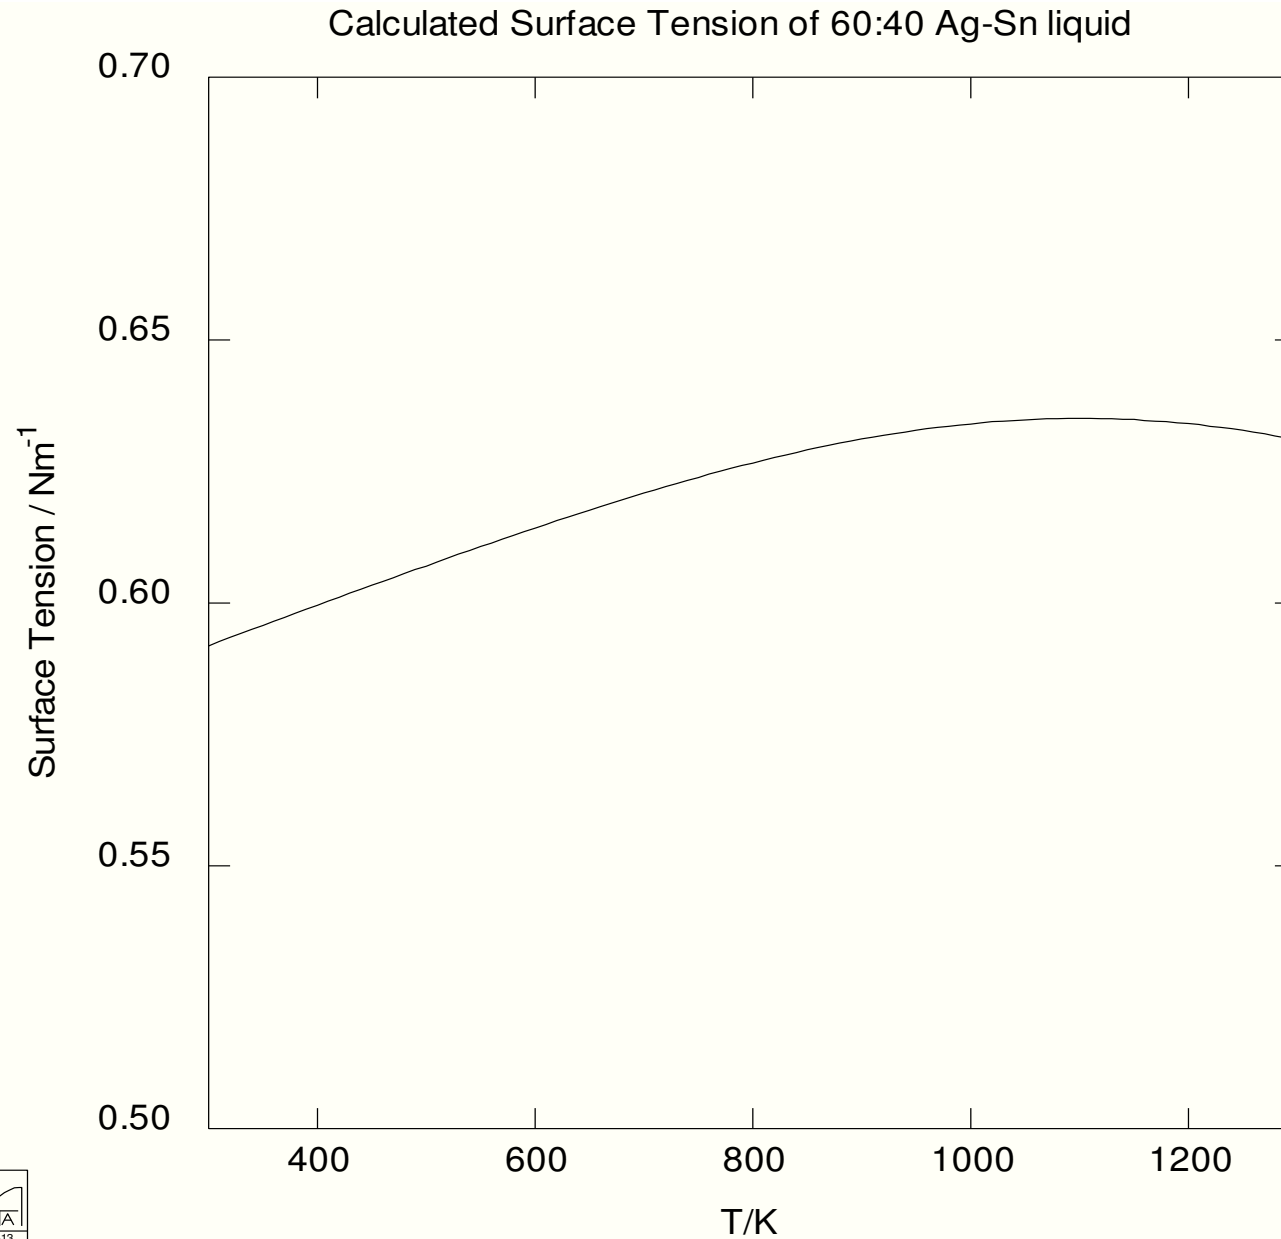

# Use thermodynamic properties to model surface tension

- Based on the approach of Tanaka using the **Butler equation**
- Assumes an **equilibrium** between the bulk liquid and the surface liquid
- Easily generalised and extended to **cover multicomponent systems**
- Butler equation shows relation between the surface tension of the binary alloy to the surface tension of the pure components and the thermodynamic properties of the **bulk and the surface monolayer**
- Equivalent to expressing **chemical equilibrium** between the bulk liquid and the surface
- **Bulk** liquid properties modelled from solders database
- **Non-ideal interactions** in the surface monolayer taken to be a proportion of those for bulk liquid

# Ag-Sn 40%Sn : effect of temperature

# Surface composition: Bi-Sn 608 K

# Sn-Ag-Cu: variation with temperature

## How you can access the database

- Database will not be published as such (ie as for COST507)
- Will be available to **COST531 and MP0602** partners for internal use
- Now available through software providers (eg **TCSAB, NPL, GTT**) in association with SGTE
- Income will be used to support **further database development**

# Conclusions and Future work

- **COST**
  - COST531
  - MP0602 - HISOLD
- **COST531 thermodynamic database**
  - Scope of the database
  - Emphasis on consistency
- **How the database can be used**
  - Understanding of the interface between substrate and the solder
  - Predict liquidus and solidus temperatures of candidate solders
  - Modelling surface tension
  - Understand volume changes associated with solidification
  - Understand issues of contamination of lead free solder

Thank you for your attention
