1. XPS | Expert Process Solutions, a Glencore Company, 6 Edison Road, Falconbridge, Ontario, Canada, P0M 1S0

2. Koniambo Nickel SAS, Route Territoriale 1, Site de Vavouto – Voh, P.O. Box 679 – 98860 Koné, New Caledonia

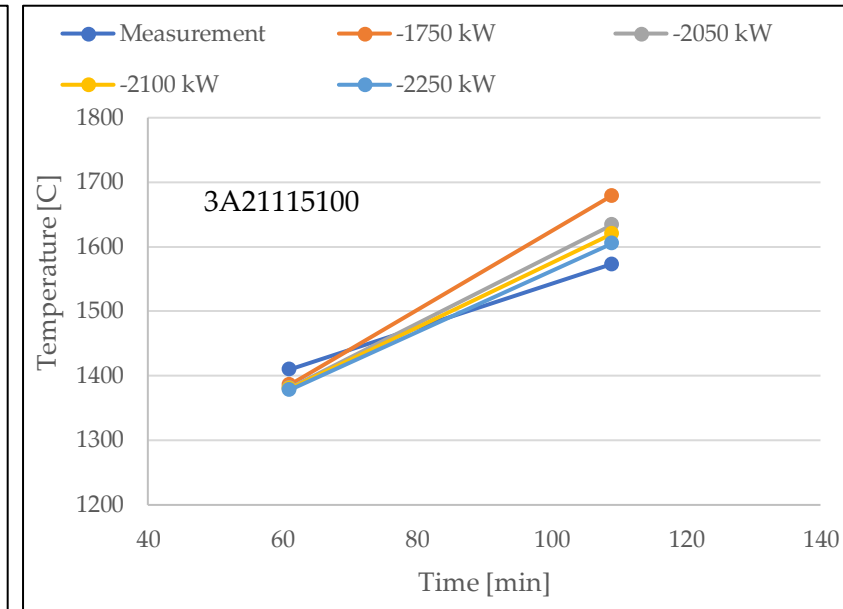

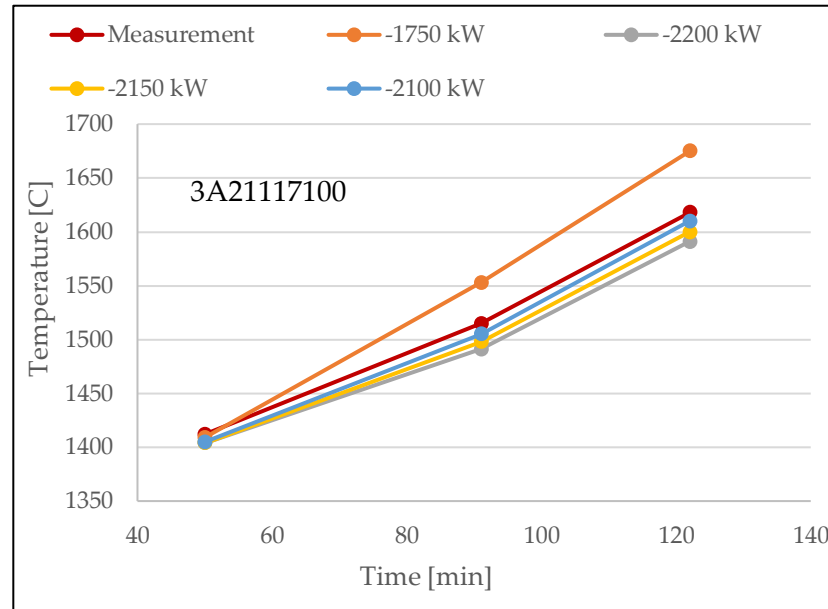

- Introduction & Objectives
- Process description
- Modelling approach
- Discussion
- Summary

- The main objective is to develop an application to simulate the ferronickel refining step at Koniambo Nickel SAS (KNS)
  - The main interest is in accurately predict the desulfurization.
- An offline application was built and is considered as proof of concept to implement a similar approach to real-time process monitoring for KNS ferronickel refinery.
- A subsequent objective is to validate that the application can be converted to an online model with the plant control system, in a future phase.

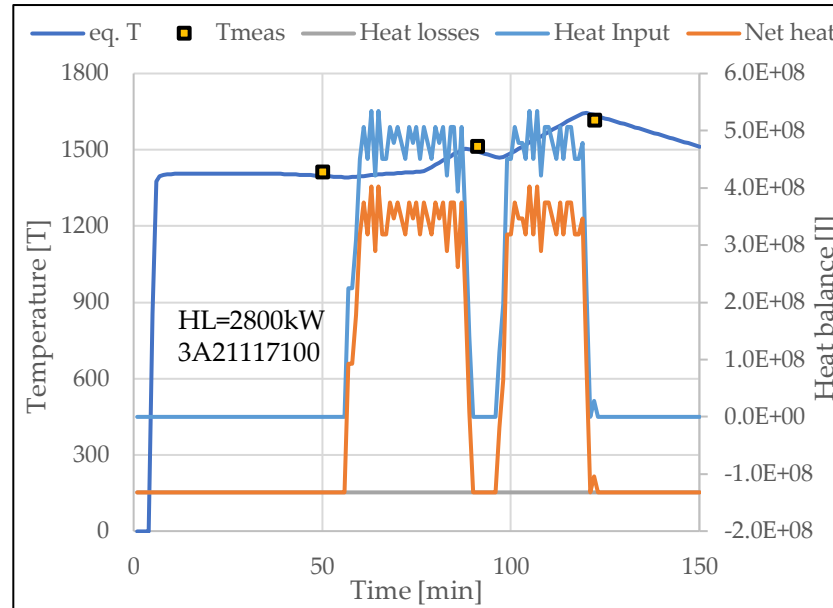

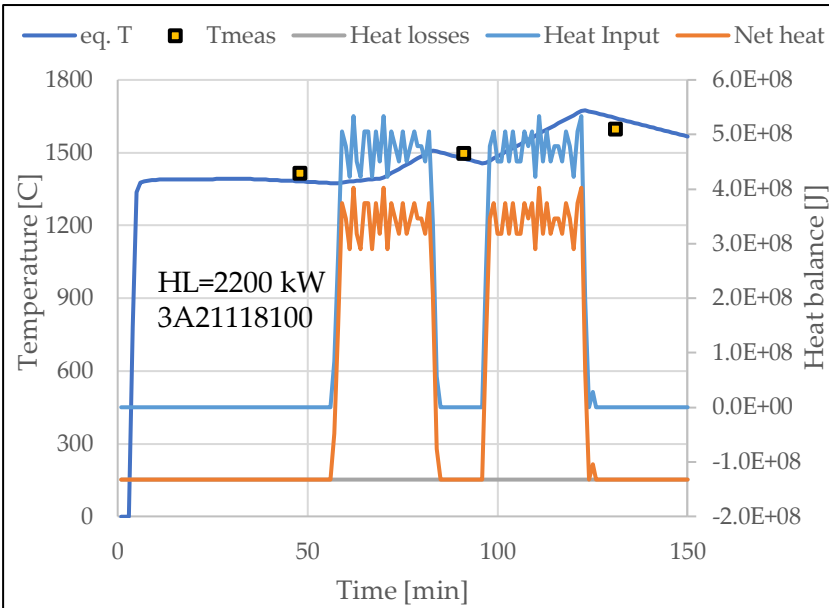

- The case consists in the refining of Ferronickel in a ladle furnace. During the process, the metal before treatment is analyzed to determine the initial chemical composition and determine the amount and batches of reagents needed to reduce impurities. The liquid metal is treated with or without a quantity of recycled metal/alloy (Revert). The reactants are added to the ladle furnace following gas stirring and heating procedures.
- All the steps are considered in the form of time-dependent streams in the thermodynamic model.
- The model is built according to the system of components and constituents verified in different partial equilibrium at different temperature ranges. The details of the constituents will be presented in the section related to the input files.

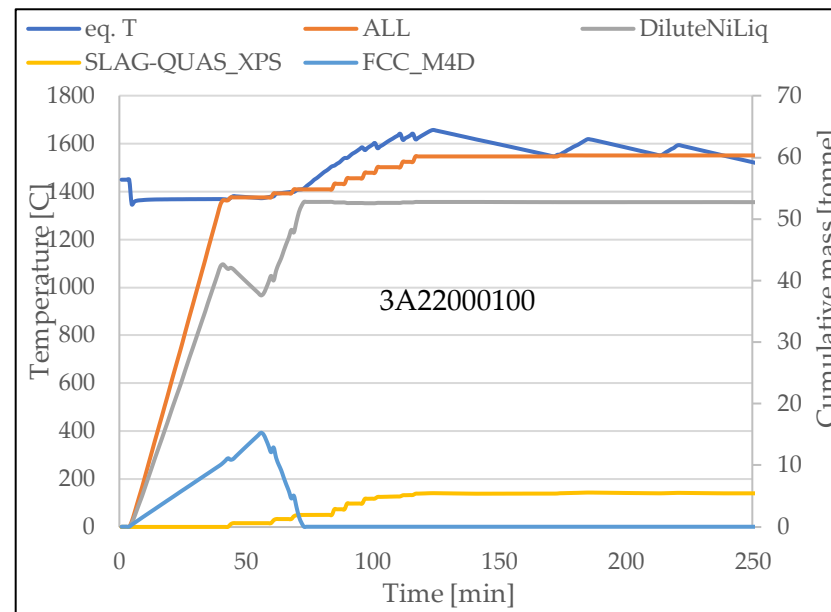

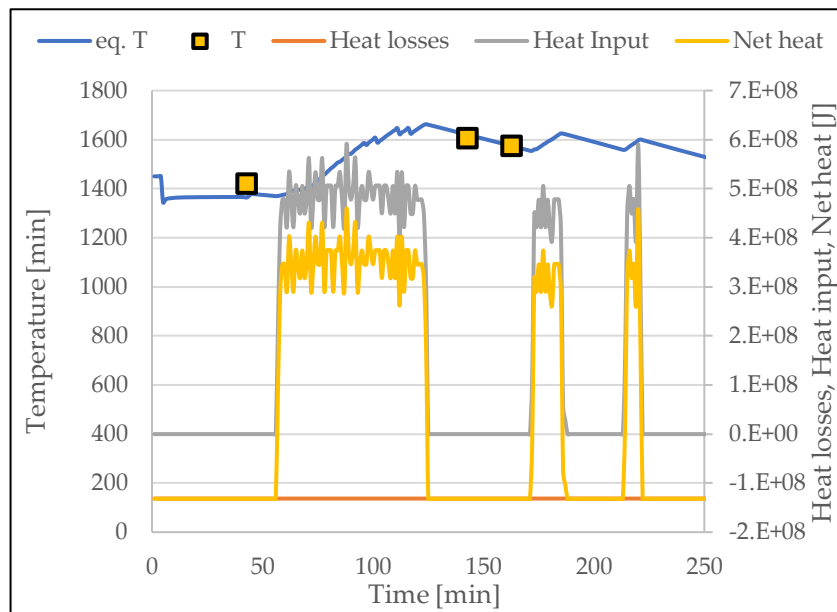

Heat losses calibration runs

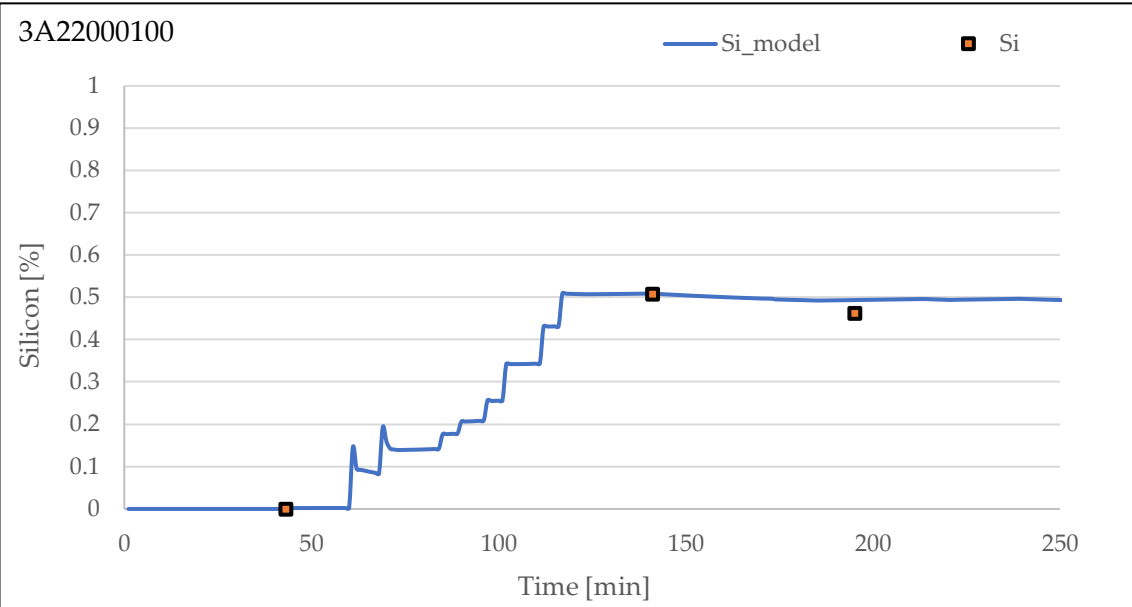

Heat losses calibration runs

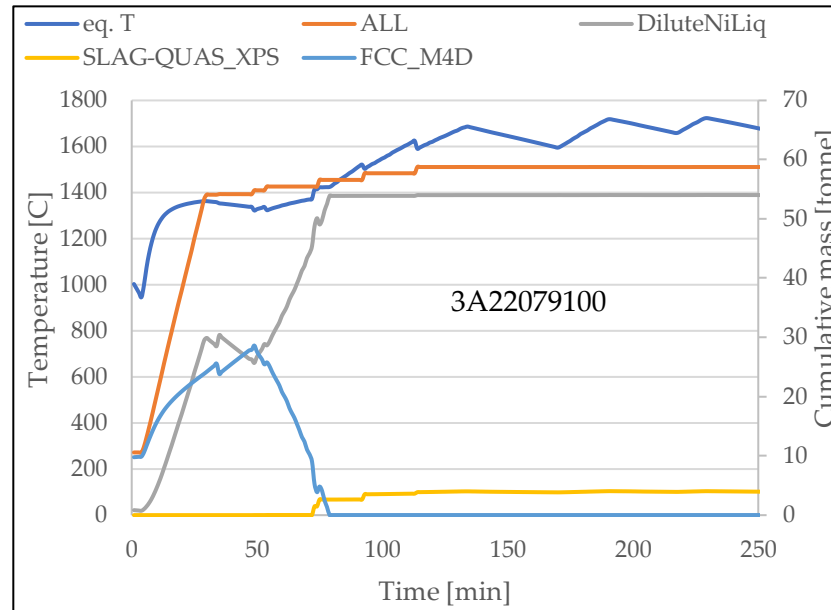

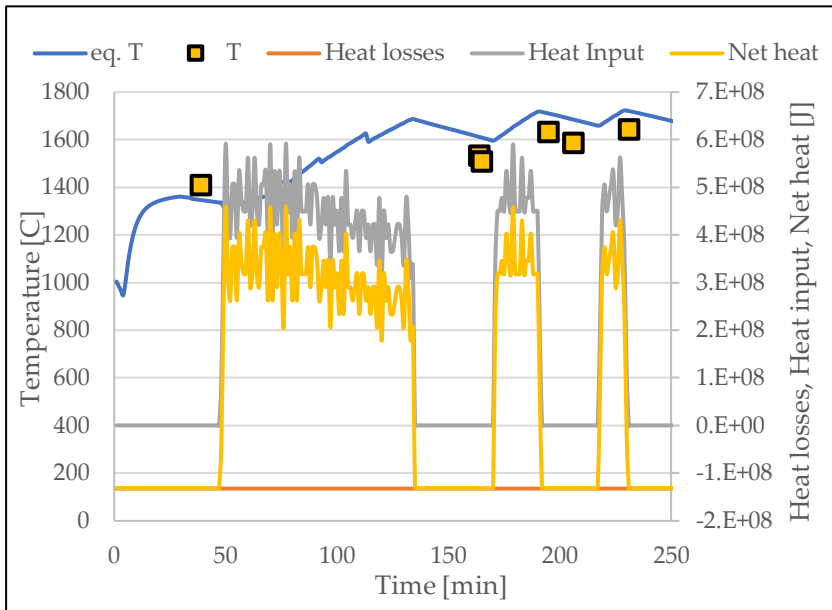

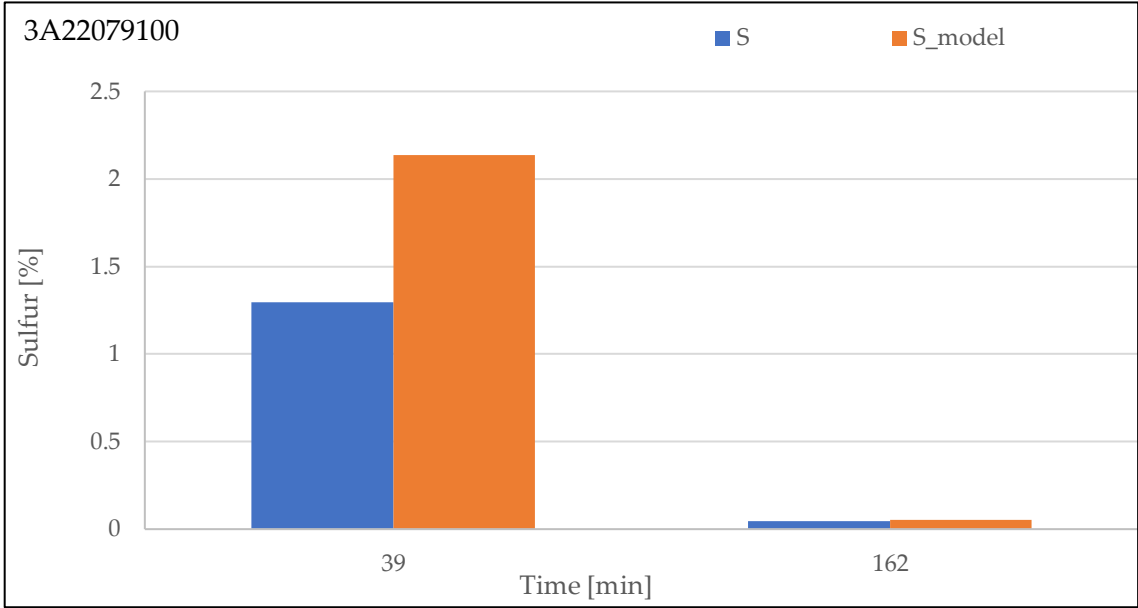

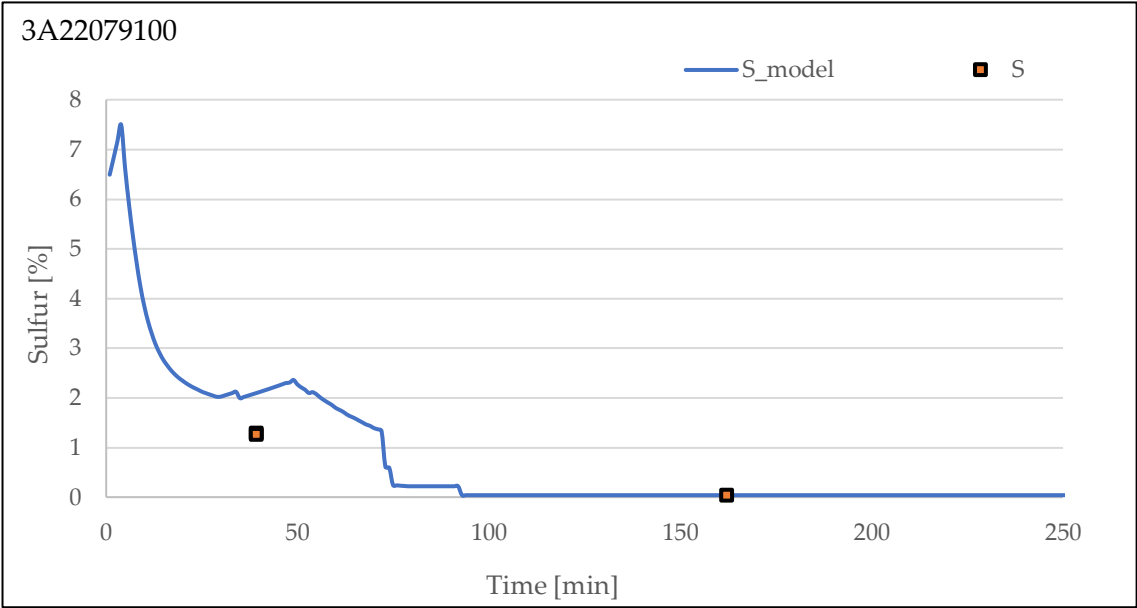

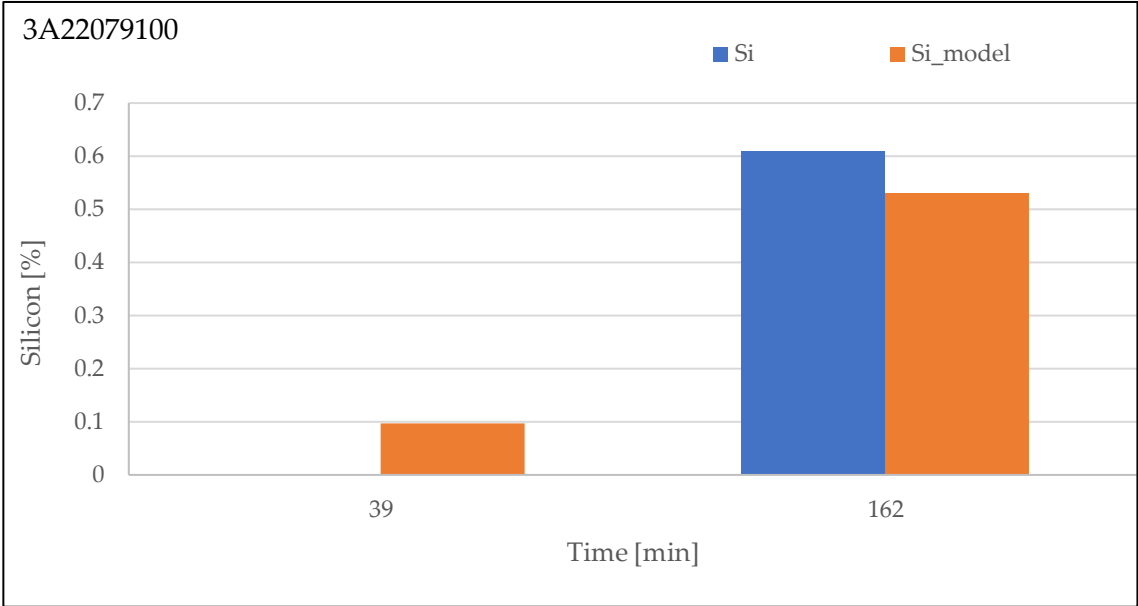

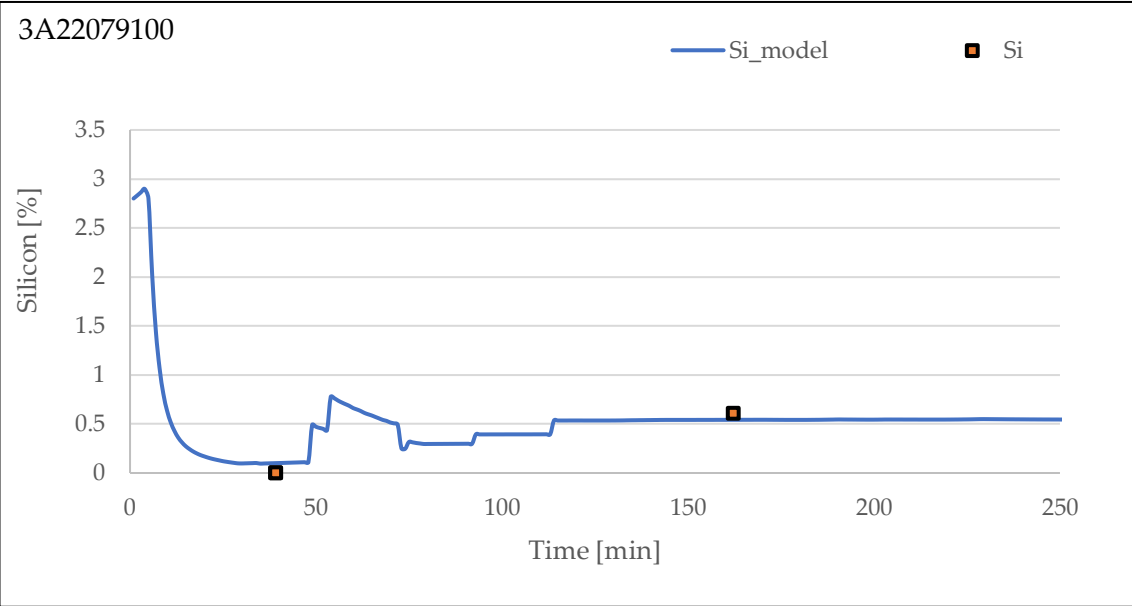

- The input plant data must be adjusted and formatted manually so that the model can read it as a script,
- More measurements must be taken during the process and further automate the acquisition of information to avoid missing data and recalibrate the model dynamically,
- The model is capable to predict the desulfurization process,
- The model can be converted to an online Digital Twin model in the future allowing KNS to use it as a Decision Making Application.
